

Precision of Minster O.B.I. Presses safeguards quality and protects progressive dies for Automatic Electric Co.

Automatic Electric Company, Northlake, Illinois, manufactures telephones and high precision communications relay equipment. The company uses Minster Job-Tailored No. 4, O.B.I. presses to meet high quality control standards of stampings from a wide variety of metals.

The extremely rigid construction and precise alignment of Minster presses provides protection for expensive compound progressive dies and assures part accuracy.

Minster's Press Productivity Team and Automatic Electric's own engineering staff worked closely together to "Job-Tailor" over 20 features into these units, including die and protective devices, stock end and buckle detectors, and special control circuitry. As a result, one operator handles several presses on automatic production. The presses operate three shifts at least five days a week all year. For steady production, highest quality and minimum downtime . . . call on Minster.
